

Panels (b)-(f): median over postal-code areas of the weekly cost saving of that area against its own daily-delivery baseline, routing lens; band = IQR of the routing-optimal plan. Each LSP is shown at its own knee P^* of this lens. A cell's cost is its own tour plus a parcel-proportional share of every pooled tour it rides in; the per-area costs sum exactly to the grid's routing total (identity gate, 72_). Cost model: 189.15 EUR/vehicle-day + 0.3864 EUR/km + 36 EUR/route-hour (VROOM per_hour default).
