

-○- baseline (daily delivery) -●- operator-polished plan (stage 2)
 -■- routing-optimal plan (stage 1) Σ peaks = fleet kept for the week (Σ weekly depot maxima, index)

Vehicles per weekday, index (class baseline weekly mean = 100)

$\theta = 1$ (full adoption). Carrier classes: routing-lens knee taxonomy (Fig. 6b). Rows share one axis; the routing-optimal plan spends the weekday freedom on cheap days, the operator polish spends it on a flat week.
