

- baseline (daily delivery)
- operator-polished plan (stage 2)
- routing-optimal plan (stage 1)
- fleet kept for the week (Σ weekly depot maxima)

Grid v6, $\theta = 1$, $P = 0.25$ €/parcel/day. A line is the vehicles an LSP runs that day across all its depots; dotted = the fleet it must keep (Σ of the weekly per-depot maxima), which is what the operator lens bills. Vehicles are [parcels / capacity] per own tour or pooled group and do not depend on prices.
