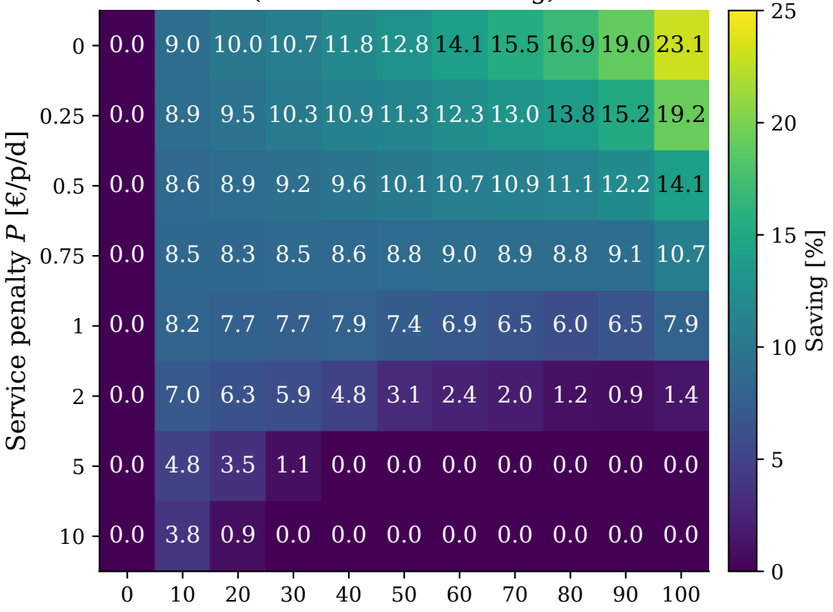
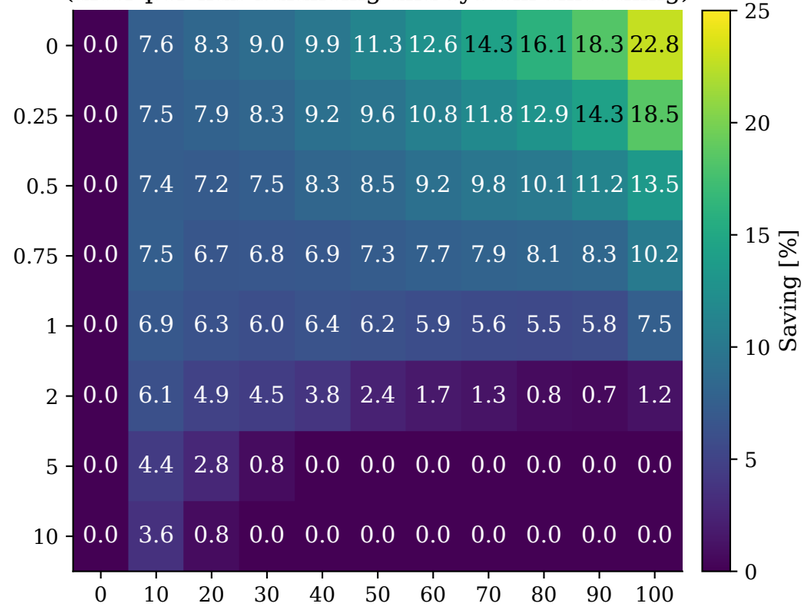
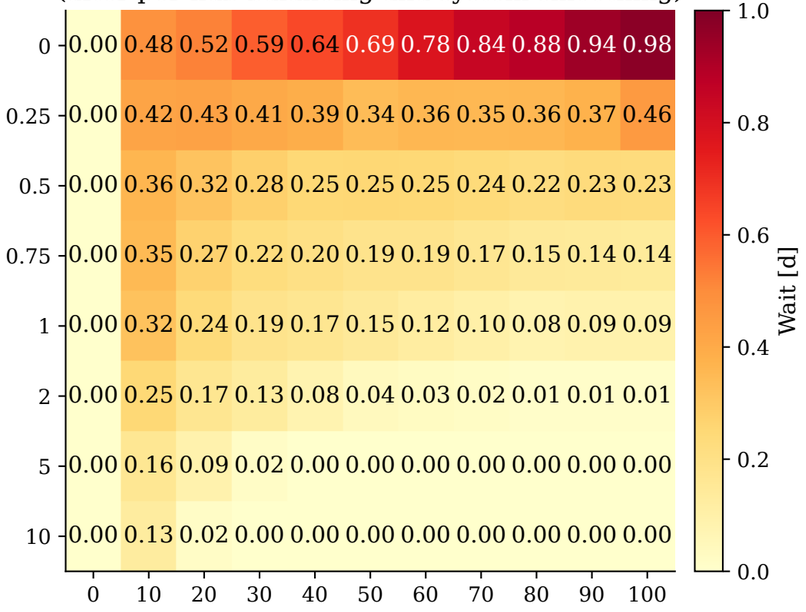
(a) Cost saving, cost-optimal selection
(before fleet balancing)



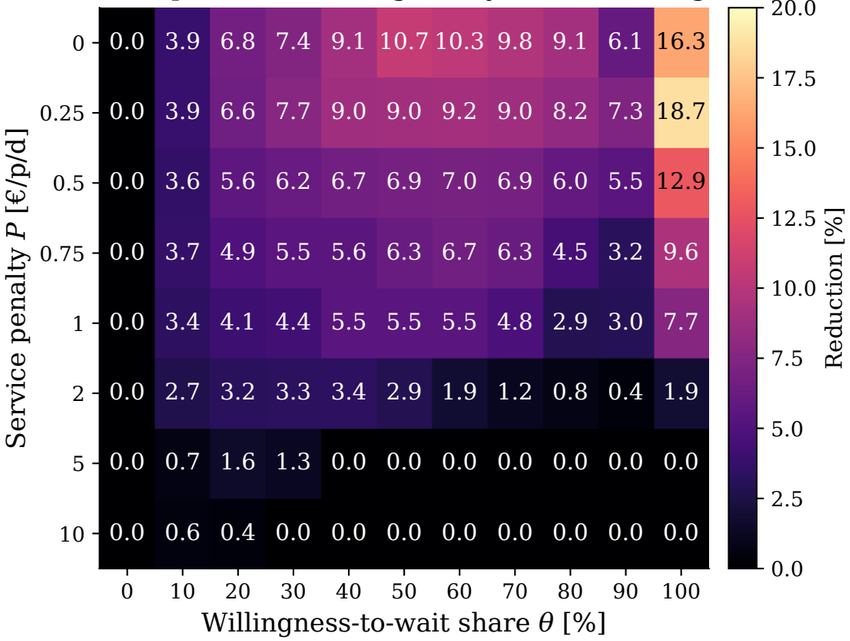
(b) Cost saving, full pipeline
(after per-hub balancing and system smoothing)



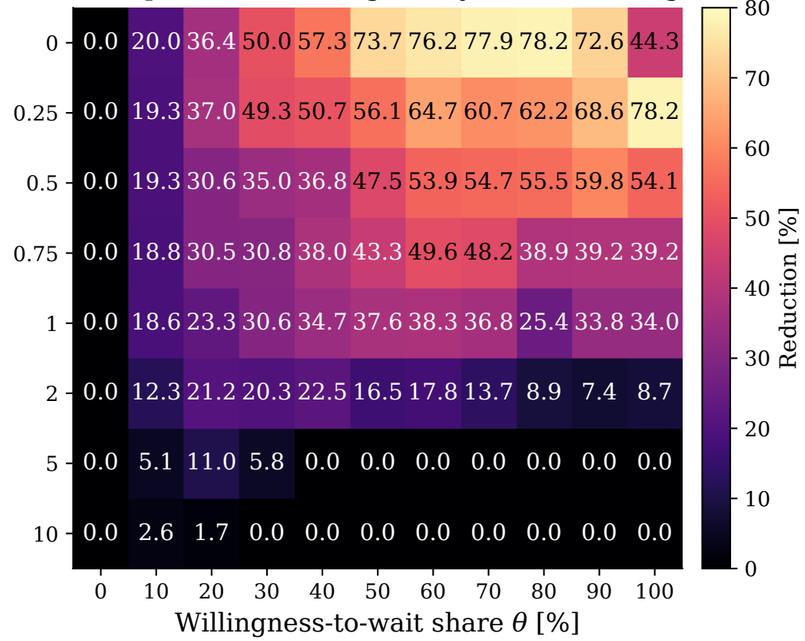
(c) Mean additional customer wait per parcel
(after per-hub balancing and system smoothing)



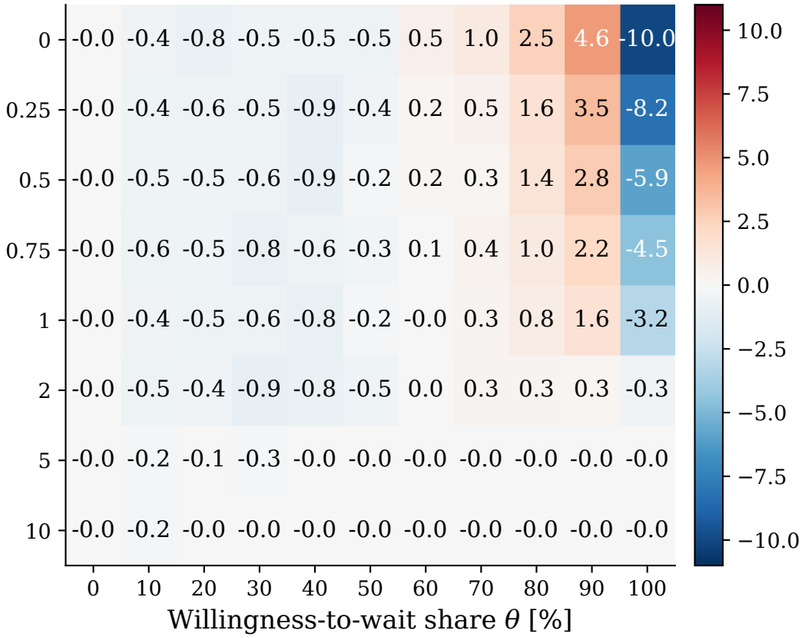
(d) Peak-fleet reduction
(after per-hub balancing and system smoothing)



(e) Mo--Sa coefficient of variation reduction
(after per-hub balancing and system smoothing)



(f) Total weekly fleet change [%]
(after per-hub balancing and system smoothing)



All cost savings, fleet reductions and the wait metric are reported relative to the daily-delivery baseline at $\theta = 0$.
